

Stages Of A Butterfly

Stage 1: The Egg

To begin the amazing life cycle, a butterfly will lay eggs on the leaf. Depending on the type of butterfly, the eggs will vary in size, shape, texture and even color. This amazing first introduction to the world is proof that God created everything beautiful right from the beginning, each aspect in its own way.

Stage 2: The Larva

The larva hatches out of their eggs and begin their adventure in the world. This stage is short-lived and focuses entirely on eating. Since a butterfly will lay its eggs on a leaf, this leaf should be the right kind that the caterpillar will enjoy eating. God shows his wonder, here, as he helps each butterfly egg find the right leaf for its growth and strength.

Stage 3: The Pupa

In this stage, the caterpillar builds itself a safe resting spot where it will go through its change. A cool fact is that a lot of people think that this stage is a restful one, but it is the most active one. Each part of the butterfly transforms into its final form. God watches over this chrysalis throughout the transformation to keep it safe.

Stage 4: The Butterfly

This final stage allows for a butterfly to emerge, fully-grown from the safety of its protective covering and within a few hours, it flies away to find its mate and repeat the process over again with the next generation.

Throughout each stage of their life, God's presence is seen. He helps larvae flourish by making her that they are laid on the proper leaves for them to eat. He helps keep each chrysalis safe while the caterpillar focuses on its transformation, and then he helps give the butterfly protection as it flies off to find its mate.

God creates amazing creatures that have equally amazing steps and stages in their life cycle. It shows us that, with His help, there is beauty in all parts of life.
